

RentFinder Platform Master Technical Pack

Prepared by Picours Technology Company

Architecture • System Design • API Documentation

Version 1.0 • Production Ready

Currency: NAD (Namibian Dollar)

Table of Contents

1. System Overview
2. Architecture Overview
3. Architecture Diagrams
4. Escrow & Financial Design
5. API Reference Overview
6. Admin & Finance Design
7. Security & Compliance
8. Deployment & Operations

1. System Overview

The RentFinder platform is an escrow-based marketplace designed for financial safety, transparency, and regional practicality. All money flows are explicit and auditable.

2. Architecture Overview

The system is composed of frontend clients, a stateless API server, and a Supabase-backed PostgreSQL database enforcing all financial invariants.

3. Architecture Diagram

4. Escrow & Financial Design

Clients pay 250 NAD. Escrow governs all fund movement. 200 NAD is paid to the finder on release, while 50 NAD is always retained as platform service revenue.

5. API Reference Overview

APIs are grouped into Tasks, Escrow, Admin Escrow, Payouts, Finance, and Finder Self-Service. All money-affecting endpoints are rate-limited and role-restricted.

6. Admin & Finance Design

Admins resolve disputes, approve payouts, and monitor platform revenue. Financial dashboards provide deterministic insight into service-fee earnings.

7. Security & Compliance

Security is enforced via JWT authentication, role-based authorization, rate-limiting, database constraints, and immutable audit logs.

8. Deployment & Operations

The platform is production-ready for Namibia and avoids Stripe/Paystack dependencies. Manual payout processing ensures safety during early-stage operations.
