

RentFinder Platform Backend System Documentation & API Reference

Prepared by **Picours Technology Company**
Version 1.0 • Production Ready
Currency: NAD (Namibian Dollar)

1. System Overview

The RentFinder platform is an escrow-based marketplace connecting busy individuals with verified rent finders. The system guarantees secure payments, transparent handling of funds, and auditable financial operations while retaining a fixed service fee for platform sustainability.

2. Core Business Rules

- Client Payment: **250 NAD**
- Finder Receives: **200 NAD**
- Platform Service Fee: **50 NAD (non-refundable)**

Escrow is created after lead acceptance, must be paid before work starts, and is finalized through release, cancellation, or dispute resolution.

3. User Roles

- **Busy Individual:** Pays escrow, verifies tasks, cancels or disputes escrows.
- **Rent Finder:** Completes tasks, manages payout preferences, views earnings.
- **Admin:** Resolves disputes, manages payouts, oversees revenue and audits.

4. Escrow Lifecycle

submitted → accepted → escrow_created → paid / held → released | cancelled | disputed → payout processing & completion

5. Authentication & Security

All API endpoints require JWT authentication using Bearer tokens. Role-based access control ensures that only authorized users can perform sensitive financial actions.

6. Audit & Compliance

All escrow and payout operations are recorded in immutable audit logs, including actor, timestamp, action, and amount. These logs support transparency, compliance, and dispute resolution.

7. Deployment Readiness

The backend is production-ready for Namibia, operates without Stripe or Paystack dependencies, and supports manual bank and mobile money payouts under strict admin control.

Appendix: Platform Guarantees

- Exactly one payout per escrow (database enforced).
- Platform service fee is always retained.
- No automatic money movement without admin confirmation.
- Full transparency via escrow timelines and dashboards.
